

Robustness audit of the local RG-window probe (8 regimes, 10976 lattice nodes)

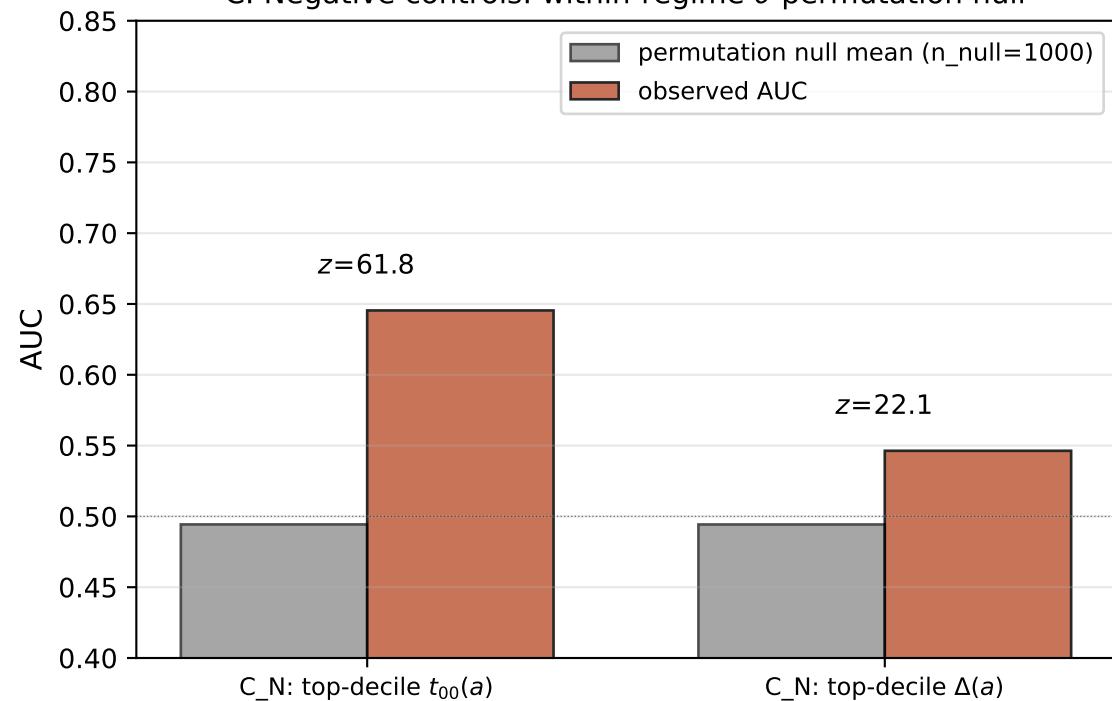

A. Bootstrap 95% CIs (regime-relative $\theta_{\text{glob}}(N)$ threshold)

B. Leave-one-regime-out (8/8 folds with Ξ -row-variance as top candidate for t_{00} and Δ targets)

C. Negative controls: within-regime θ permutation null

D. Regime-relative threshold scan ($\theta_{\text{glob}}(N) + \Delta$)
